### Factoring a Monomial GCF Out of a Polynomial

### Factoring by Grouping

### GUIDED EXAMPLE

Factor  $24xy^3 + 32y^2$ .

**Solution**

First find the GCF of  $24xy^3$  and  $32y^2$ . Write the prime factorization of each monomial, treating the variables like prime factors.

$24xy^3 = \boxed{\phantom{2 \cdot 2 \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y}}$

$32y^2 = \boxed{\phantom{2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot y \cdot y}}$

GCF:  $\boxed{\phantom{2 \cdot 2 \cdot 2 \cdot y}}$

$24xy^3 + 32y^2 = \boxed{\phantom{2 \cdot 2 \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y + 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot y \cdot y}}$

$= \boxed{\phantom{2 \cdot 2 \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y + 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot y \cdot y}}$

$= \boxed{\phantom{2 \cdot 2 \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y + 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot y \cdot y}}$

**Write the polynomial as the product of the GCF and the quotient of the polynomial and the GCF.**

**Separate the terms.**

**Divide the terms by the GCF.**

## Chapter 7 FACTORING

### 7.2 Factoring Trinomials of the Form $x^2 + bx + c$

#### KEY PROPERTIES, PROCEDURES, OR STRATEGIES

#### Factoring $x^2 + bx + c$

--

#### GUIDED EXAMPLE

- Factor  $t^2 + t - 12$ .

#### Solution

We must find a pair of numbers whose product is  $-12$  and whose sum is  $1$ . Because the product is negative, the two numbers must have different signs. Because the sum is positive, the number with the greater absolute value will be positive.

Product	Sum

Once we have found the correct combination, write the polynomial as the product of two binomials, where the numbers we found are the second terms in the binomials.

$$t^2 + t - 12 =$$

--

#### NOTES

Name:  
Instructor:

Date:  
Section:

### GUIDED EXAMPLES

2. Factor  $b^2 + 6bh - 16h^2$ .

#### Solution

The variable  $h$  is in the last term, so think of the middle term  $6bh$  as  $6hb$  with “coefficient”  $6h$ . We must find a pair of terms whose product is  $-16h^2$  and whose sum is  $6h$ .

Product	Sum

$$b^2 + 6bh - 16h^2 =$$

3. Factor  $7z^6 - 28z^5 - 147z^4$ .

#### Solution

Whenever factoring polynomials, the first step should be to look for a monomial GCF among the terms.

GCF:

Now try to factor the trinomial to two binomials. We are looking for two numbers whose product is negative and whose sum is negative, so the numbers will have different signs and the number with the greater absolute value will be negative.

Product	Sum

$$7z^6 - 28z^5 - 147z^4 =$$

## Chapter 7 FACTORING

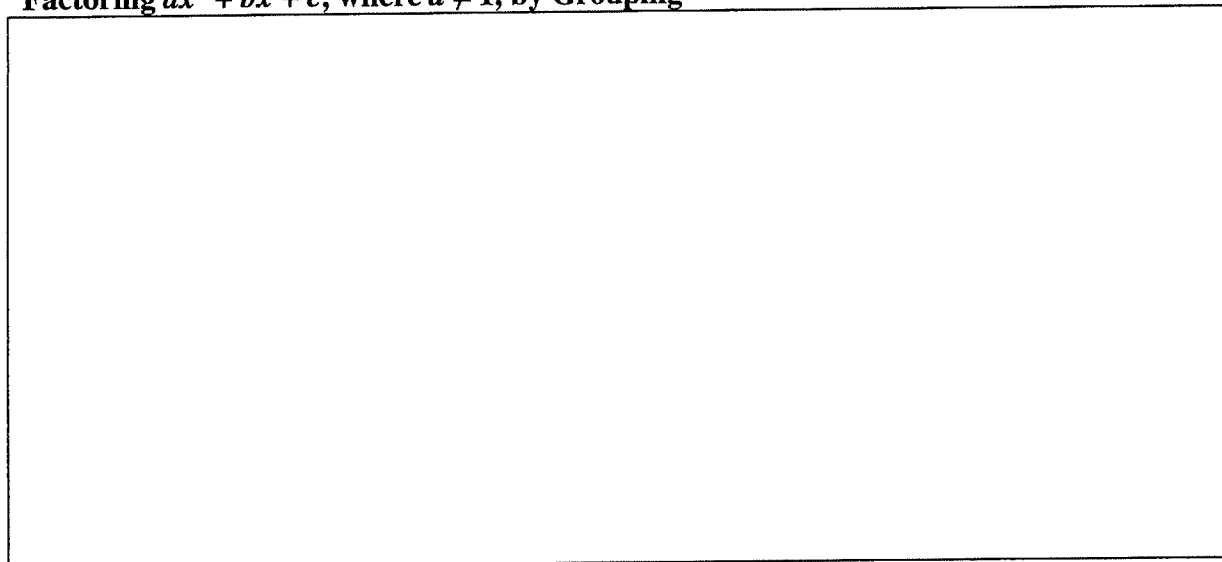

### 7.3 Factoring Trinomials of the Form $ax^2 + bx + c$ , where $a \neq 1$

#### KEY PROPERTIES, PROCEDURES, OR STRATEGIES

##### Factoring by Trial and Error

##### Factoring $ax^2 + bx + c$ , where $a \neq 1$ , by Grouping

Name:  
Instructor:

Date:  
Section:

### GUIDED EXAMPLE

Factor  $32v^2 + 20v - 3$  by grouping.

#### Solution

For the trinomial  $32v^2 + 20v - 3$ ,

$$a = \underline{\hspace{2cm}}, \quad b = \underline{\hspace{2cm}}, \quad c = \underline{\hspace{2cm}}$$

Find the product  $ac$ :  $\underline{\hspace{2cm}}$

Now find two factors of this product whose sum is  $b$ . Because the product is negative, the factors have different signs. Because the sum is positive, the factor with the greater absolute value must be positive.

Factors of $ac$	Sum of Factors of $ac$

Now use the factors found in the table to write the middle term of the polynomial as a sum of two like terms.

$$32v^2 + 20v - 3 = \boxed{\hspace{10cm}}$$

Factor the new polynomial by grouping.

Answer:  $32v^2 + 20v - 3 = \boxed{\hspace{10cm}}$

## Chapter 7 FACTORING

### 7.4 Factoring Special Products

#### KEY PROPERTIES, PROCEDURES, OR STRATEGIES

##### Factoring Perfect Square Trinomials

--

##### Factoring a Difference of Squares

--

NOTES

Name:  
Instructor:

Date:  
Section:

### GUIDED EXAMPLE

Factor  $49v^2 - 56v + 16$ .

#### Solution

Look at the terms in the trinomial  $49v^2 - 56v + 16$  to determine whether the trinomial fits the form of a perfect square.

$$49v^2 = \left( \quad \right)^2$$

$$16 = \left( \quad \right)^2$$

$$56v = 2 \cdot \left( \quad \right) \cdot \left( \quad \right)$$

The first and last terms of the trinomial are perfect squares and the middle term is equal to twice the product of the square roots of the first and last terms. So  $49v^2 - 56v + 16$  is a perfect square trinomial fitting the form  $a^2 - 2ab + b^2$ . We can write the factored form as  $(a - b)^2$ , where

$$a = \underline{\hspace{2cm}} \text{ and } b = \underline{\hspace{2cm}}$$

Answer:  $49v^2 - 56v + 16 =$

### 7.5 Strategies for Factoring

#### KEY PROPERTIES, PROCEDURES, OR STRATEGIES

##### Strategies for Factoring

Name:  
Instructor:

Date:  
Section:

### GUIDED EXAMPLES

Factor.

a)  $a^2 + 13a + 42$

**Solution**

First factor out any monomial GCF. There is no monomial GCF in this polynomial. There are three terms in this polynomial, so check to see if it is a perfect square.

Are the first and third terms both perfect squares? \_\_\_\_\_

Now consider the form of the trinomial. It has form \_\_\_\_\_.

So find two factors of  $c$  whose sum is  $b$  and write the factored form as  
( $a +$  first number)( $a +$  second number).

Answer:  $a^2 + 13a + 42 =$

b)  $ac + ad + bc + bd$

**Solution**

First factor out any monomial GCF. There is no monomial GCF in this polynomial. There are four terms in this polynomial, so try factoring by grouping.

Answer:  $ac + ad + bc + bd =$
